

## 11.A.2 Search Method (for Oversea Situations)

### 11.A.2.A. Explanation of Index Data

#### 11.A.2.A.1 Index Data Structure

The following shows an overall configuration of index data.

**Index Data Structure**

## 11.A.2.A.2 Indexed Data File Configuration

### 11.A.2.A.2.1 Indexed Data Configuration Rules

```
Root directory
|   ALLDATA.KWI (KIWI data - management file)
|   :
|   INDEX DAT.KWI (Index data - management file)
|
— IDX (Subdirectory: For Chapter 11)
    POISRC01.IDX (Subfile for each retrieval unit)
    POISRC02.IDX
    :
    POISRC04.IDX
```

#### 11.A.2.A.2.1.1 Indexed Data Management File

The index data management file is placed just under the root directory in the configurations specified in Chapter 2, "Data Configuration on a Medium."

Index data management file: "INDEXDAT.KWI" (Index data - The data management frame is placed on the beginning of a file.)

#### 11.A.2.A.2.1.2 Indexed Data Subdirectory

All the configuration files other than the index data management files are stored under the following subdirectory. This version does not define further divided subdirectories.

Individual index data - storage subdirectory: "IDX" (The data is placed in the same directory as the KIWI data management file.)

#### 11.A.2.A.2.1.3 Indexed Data Subfile

The index data subfile is added with ".IDX" as an extension at the end of a filename.

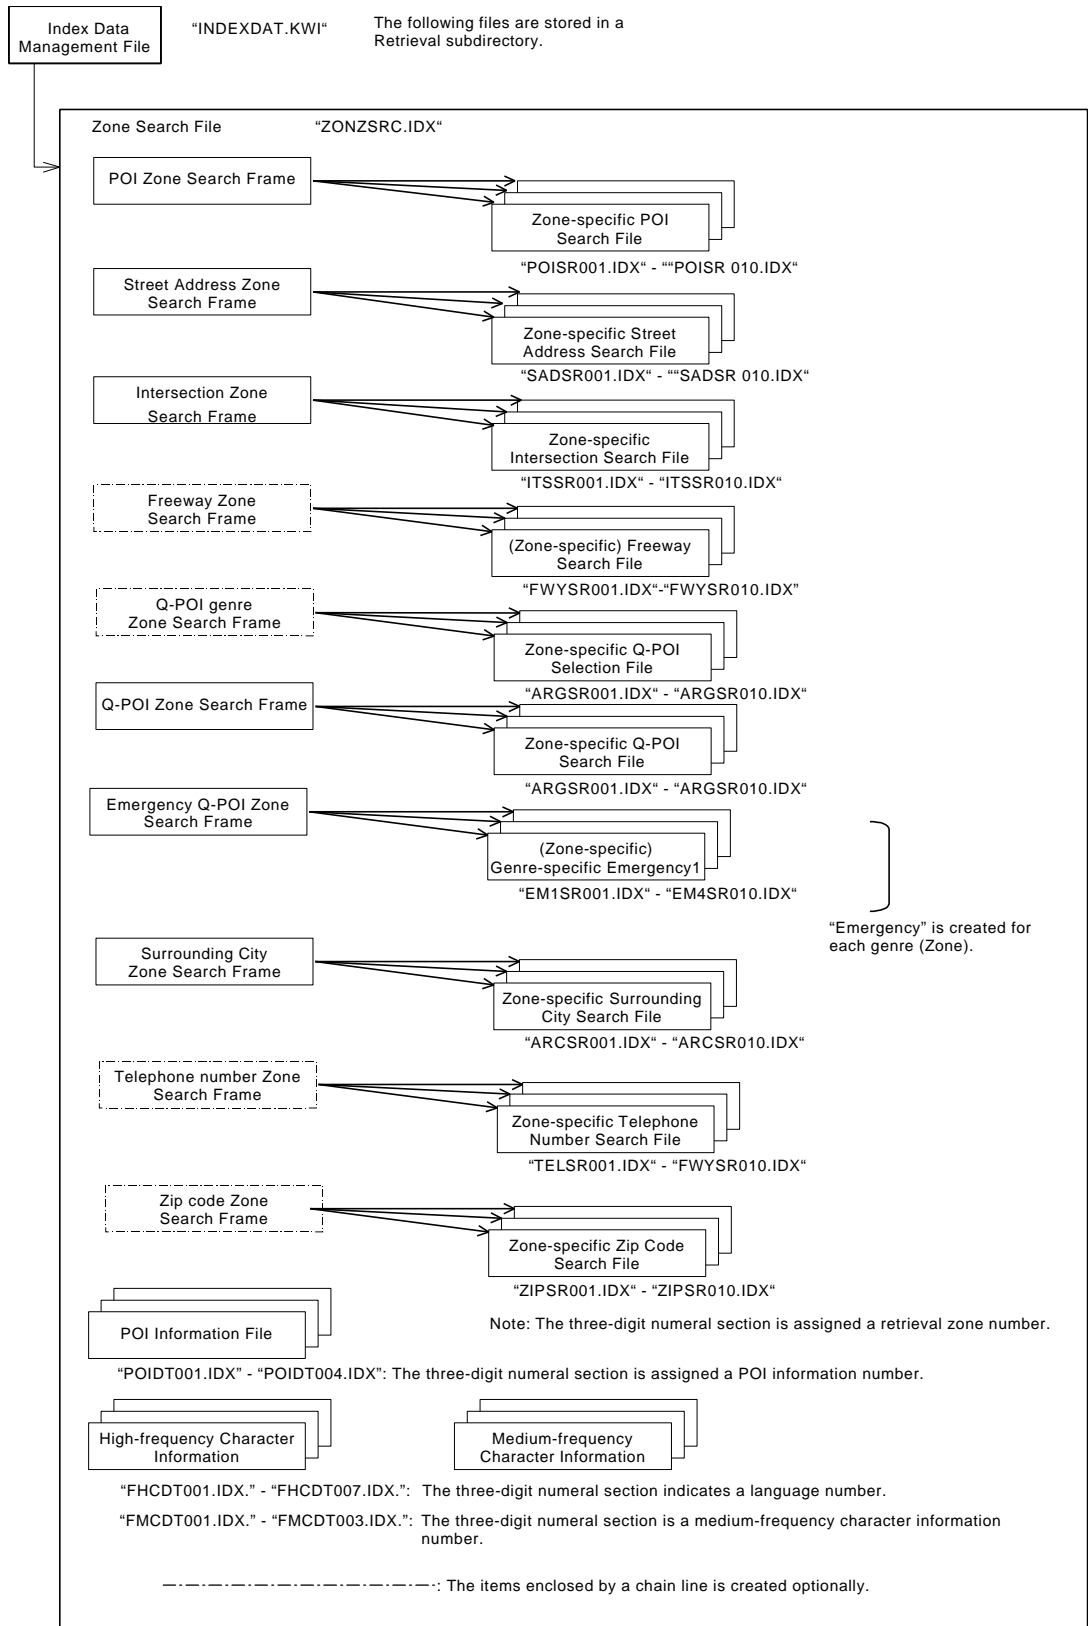

#### 11.A.2.A.2.1.4 Indexed Data Filename Setting Rules

The filename described in the index data is represented with a relative path name from the directory in which the data management frame (index data management file) exists. The delimiter mark between directories is a back slash (\).

Note: All filenames and directory names actually stored are described one-byte upper-case characters.

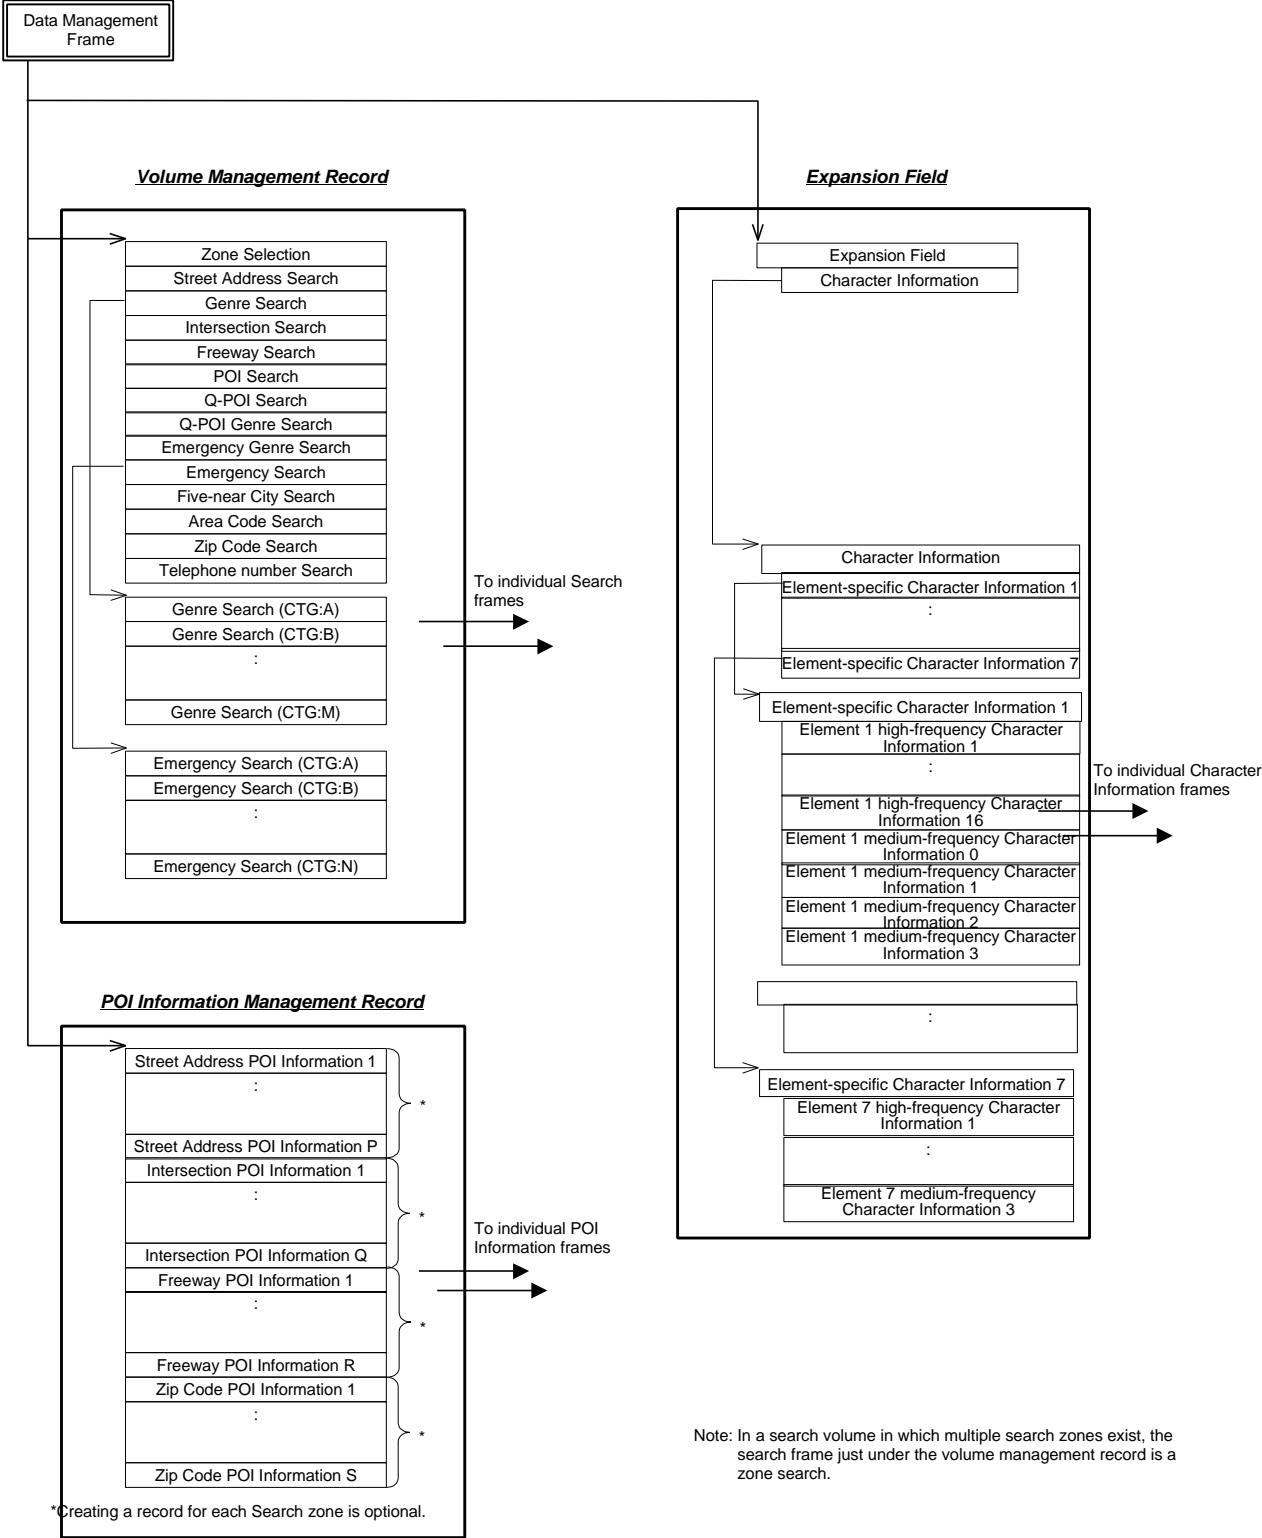

Examples: IDX\POISRC01.IDX, IDX\POIDAT01.IDX
